

Event Viewer

Event Viewer is a built-in tool in Microsoft Windows that allows users, administrators, and support personnel to view detailed logs about events that occur on the system. It helps monitor system health, troubleshoot problems, and keep track of important system and security-related events.

Example 1:

In our daily we use so many application or services in that one of the example .we use pen drive which is useful for us for data storing and the data transferring in system.while using we are storing our data in pen drive but our system power is not sufficient to transfer the data to pen drive .In the middle of that the system shutdown .That is the error recorded in the event viewer.

Example 2:

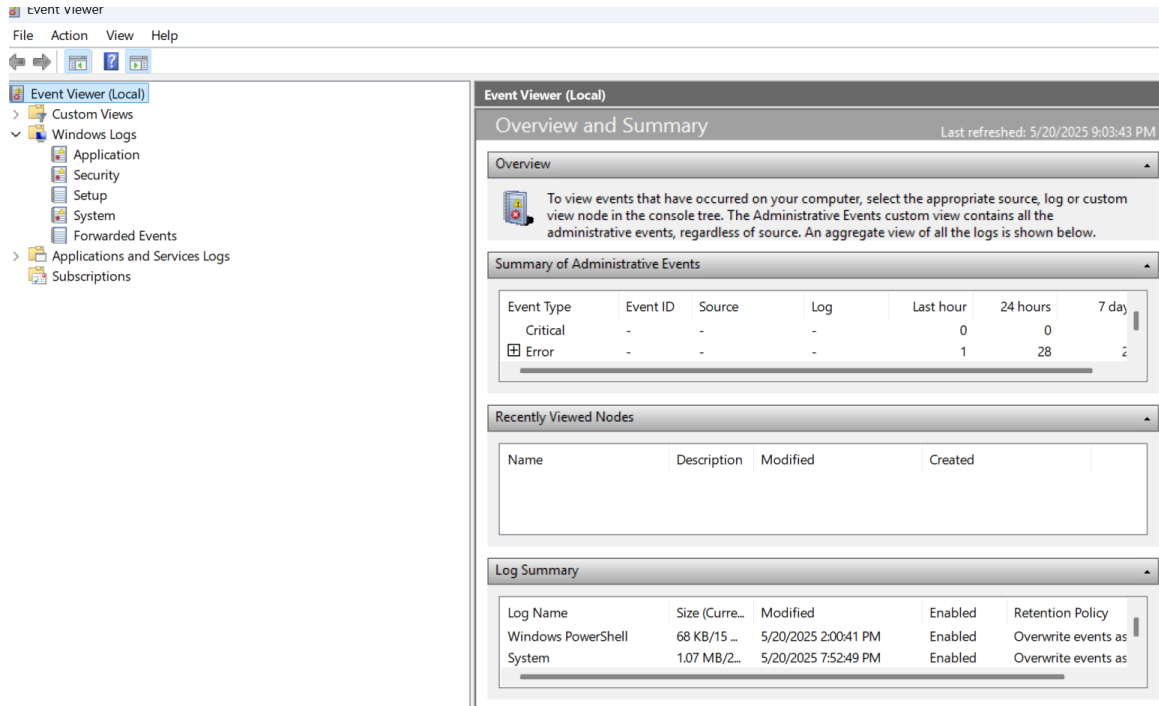

In our system sometimes our keyboard keys ,pins ,touch pad are not work one of the reason of not working is not updated divers in the system .At that time the error is recorded in the log in the form of hardware error.After update the drivers then the touch pad etc are work properly .

Event viewer record events(errors) as asystem errors or warnings ,application errors,security related errors,hardware failures errors.

In types of Logs :

- 1.Application Logs
- 2.System logs
- 3.Security logs
- 4.Setup Logs

5. Forward Events

1.Example for Application Logs:

You're shopping on Amazon using Google Chrome. You have 10+ tabs open(product pages, reviews, and comparison sites). Suddenly, Chrome stops responding. You click, but nothing happens. The window says not responding, and eventually, you're forced to close Chrome using Task Manager. The windows detect that chrome.exe has stopped responding this event will record in the Application logs.

2.Example for System Logs:

If your system takes long time to boot .if audio doesn't work or wifi is not connected.

3.Example for Security Logs:

If suppose you forgotten the password of the facebook if you try 3 times ,In 3 times you are not able to remember the correct password

then the account has be locked the windows or the software think that it might be the hacker try to crack the password Atlast we will click the forgotten password .To reset the password the link will sent to your email or send the otp to user name to change the password.

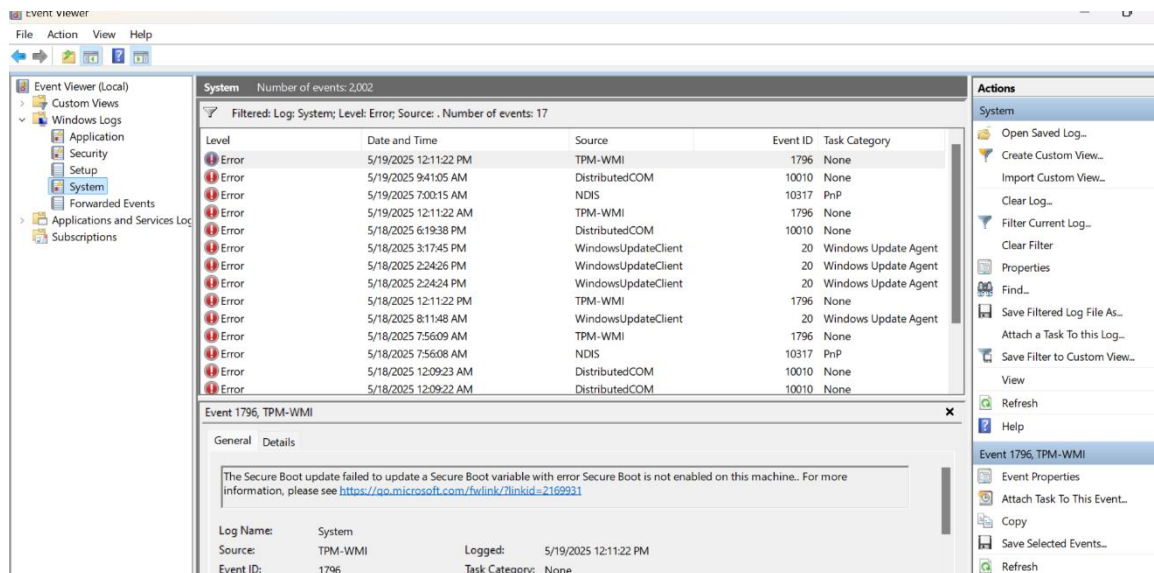

4.Example for the setup Logs:

For example you are updating the system .the update is more than the storage you have in the system or poor internet connections,some virus is there in that youe system stop updating.

5.example for the forward logs:

In company everyone have their separate system .if someone opening your system to see the company important data thet don't know the password he type the password 5 times wrong then these trigger the security event than that event is forward to the admins PC.

The errors in occurred in my system:

The screenshot displays the Windows Event Viewer application. The left pane shows the 'System' log selected under 'Windows Logs'. The main pane shows a list of 17 error events. The selected event (ID 1796) is expanded, showing the following details:

Level	Date and Time	Source	Event ID	Task Category
Error	5/19/2025 12:11:22 PM	TPM-WMI	1796	None
Error	5/19/2025 9:41:05 AM	DistributedCOM	10010	None
Error	5/19/2025 7:00:15 AM	NDIS	10317	PnP
Error	5/19/2025 12:11:22 AM	TPM-WMI	1796	None
Error	5/18/2025 6:19:38 PM	DistributedCOM	10010	None
Error	5/18/2025 3:17:45 PM	WindowsUpdateClient	20	Windows Update Agent
Error	5/18/2025 2:24:26 PM	WindowsUpdateClient	20	Windows Update Agent
Error	5/18/2025 2:24:24 PM	WindowsUpdateClient	20	Windows Update Agent
Error	5/18/2025 12:11:22 PM	TPM-WMI	1796	None
Error	5/18/2025 8:11:48 AM	WindowsUpdateClient	20	Windows Update Agent
Error	5/18/2025 7:56:09 AM	TPM-WMI	1796	None
Error	5/18/2025 7:56:08 AM	NDIS	10317	PnP
Error	5/18/2025 12:09:23 AM	DistributedCOM	10010	None
Error	5/18/2025 12:09:22 AM	DistributedCOM	10010	None

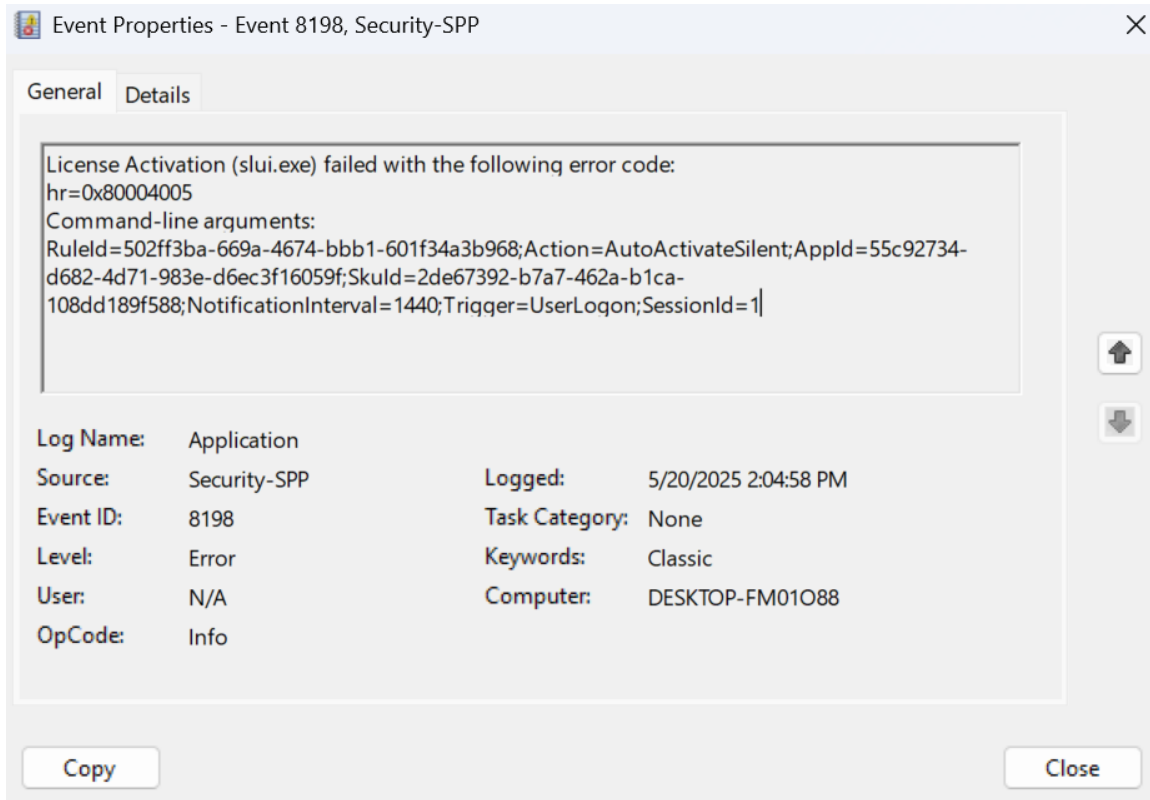

The details pane for Event 1796, TPM-WMI, shows the following message:

The Secure Boot update failed to update a Secure Boot variable with error Secure Boot is not enabled on this machine.. For more information, please see <https://go.microsoft.com/fwlink/?linkid=2169931>

Log Name: System
Source: TPM-WMI
Event ID: 1796
Logged: 5/19/2025 12:11:22 PM
Task Category: None

The errors means which tells us at which time our application is shutdown or breakdown and what is the reason for that and why it is happen that description the error that apper in your event viewer.

We are not able to solve the error I mean to solve the error some times.

Error-1

This error is Windows activation error involving the slui.exe process and the error code:hr=0x80004005 this is generic unspecified error it is appear in activation or license verification fails during windows startup,user logon causes of getting error in these case no internet connection, Corrupted licensing files or system files, Invalid Product Key, Permissions issue.

How to solve these error first check internet and firewall and run activation troubleshooter:go to settings and update and security and

activation and the troubleshoot, then activate via command line, next run SFC and DISM to fix system files, next reinstall activation files.

Error-2

Miniport Microsoft Wi-Fi Direct Virtual Adapter #2, {99b0e89b-b343-4656-ac0e-4564a8864c2e}, had event Fatal error: The miniport has failed a power transition to operational power

What is the error:

The error is system tried to wake up or power on on the wifi direct Virtual Adapter but it fail.

Miniport is to the driver that connects windows to the hardware network adapter and a power transition.

Microsoft wifi direct virtual adapter it is virtual network interface created by Windows mobile hotspot, wifi direct file transfers power management conflict means Device couldn't transition from low power to full power mode and System sleep means System power transitions were not handled properly.

How to fix it Disable and Re-enable the Adapter by open device manager and expand network adapter and disable device and enable device. next update network adapter drivers click main wifi adapter and update driver and the disable power saving for adapter wifi adapter click properties, power management and uncheck and restart WLAN autoconfig service and run network troubleshooter.
